Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified p7773 vector. Library went through one round of normalization. Library constructed by Bento Soares and M.

       /note="vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Ist strand cDNA was prepared from 12 pooled bulk tumor samples and primed with a Not I - Oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the normalization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AA805711 789 bp mRNA EST 18-FEB-1998 ns42c05.s1 NCI_CGAP_GCB1 Homo sapiens cDNA clone IMAGE:1186280 3' similar to 9b:M58342 IDURONATE 2-SULFATASE PRECURSOR (HUMAN);, mRNA

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is not normalized. (The normalized version of this library is NCI_CGAP_BR2.) Library was constructed by Bento Soares and M. Fatina Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

/clone="Cram: Kidney; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I: Site_2: Eco RI. Plasmid DNA from the normalized library NCI_CGAP_Kid5 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified CDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1323912-1325811, 1471368-1472903 and 149104-1493255). Subtraction by Bento Soares and M. Fatima Bonaldo.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 9.877; Variance 5.713; scale 1.729

	<pre>2-sulphatase; IDS; treatment; ds. Location/Qualifiers 1251777 /*tag= a /product= IDS</pre>		χ Q	Treatment of iduronate 2-sulphatase deficiency - comprises administering recombinant iduronate 2-sulphatase Example 1; Columns 23-28; 53pp; English. The present sequence encodes human iduronate 2-sulphatase (IDS). IDS deficiency can be treated by administering a recombinant human lDS that is more highly glycosylated than the naturally occurring enzyme, useful in the treatment of Hunter syndrome. The recombinant IDS may be administered in 0.5 microg/kg to 20 mg/kg doses. The administration route is oral, intravenous, intraperitoneal, intravenous, intraperitoneal, intravenous or intranasal. The recombinant IDS better uptake properties and/or a longer half-life in vivo, and is thus more efficient than naturally alycosylated IDS. Sequence 2297 BP: 553 A: 600 C: 510 G: 634 T:

comprises culturing a host cell containing a nucleic acid encoding
the enzymatically active iduronate-2-sulphatase polypeptide
Example 1; Fig 1; 53pp; Engilsh.

A method has been developed for the production of glycosylated
iduronate-2-sulphatase enzyme (IDS). The method comprises culturing
a diduronate-2-sulphatase enzyme (IDS). The method comprises culturing
cloud spreater cloud a nucleic acid encoding the enzymatically
active IDS polypeptide where the host cell glycosylates the polypeptide
cut a preater degree than a native IDS polypeptide expressed by a
natural human liver cell. The present invention. The
recombinant IDS is used to treat IDS deficiency where heparin sulphate
recombinant IDS is used to treat IDS deficiency where heparin sulphate
combinant IDS is used to treat IDS deficiency where heparin sulphate
syndrome which is manifested by e.g. severe mental retardation,
skeletal deformities and stiff joints. The recombinant IDS possesses
cinter alia an improved half life inter alia and improved uptake
properties in comparison to the naturally glycosylated molecule.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gene. IDS deficiency can be treated by administering a recombinant human IDS that is more highly glycosylated than the naturally occurring enzyme, useful in the treatment of Hunter syndrome. The recombinant IDS may be administered in 0.5 microg/kg to 20 mg/kg
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TTGCAGGACTGCAGGTTCCACCTCGCTGCCCGTTCCTTCATTTCACGTTGAGCTGTGCA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            doses. The administration route is oral, intravenous, intraperitoneal, intramuscular, subcutaneous or intranasal. Trecombinant IDS has better uptake properties and/or a longer places. It is vivo, and is thus more efficient than naturally glycosylated IDS.

Production of glycosylated iduronate-2-sulphatase enzyme (IDS) comprises culturing a host cell containing a nucleic acid encoding
the enzymatically active iduronate-2-sulphatase polypeptide
Example 1; Fig 7; 53pp; English.

A method has been developed for the production of glycosylated
iduronate-2-sulphatase enzyme (IDS). The method comprises culturing
a host cell containing a nucleic acid encoding the enzymatically
active IDS polypeptide where the host cell glycosylates the polypeptide
c a preater degree than a native IDS polypeptide expressed by a
natural human liver cell. The present invention. The
recombinant IDS is used to treat IDS deficiency where heparin sulphate
recombinant IDS is used to treat IDS deficiency where heparin sulphate
combinant in Sm anaifested by e.g. severe mental retardation,
skeletal deformities and stiff joints. The recombinant IDS possesses
c inter alia an improved half life inter alia and improved uptake
properties in comparison to the naturally glycosylated molecule.

"E coli beta galactosidase. The wild type sequence was obtained as a single stranded template and an oligonucleotide was hybridised to it to generate a popn of DNA molecules which terminate at all possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system.

The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                       SS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Introducing random point mutations into nucleic acods -
Introducing random template, annealing a primer, elongation,
by prepn of single stranded template, annealing a primer, elongation,
misincorporation, completion of molecules and screening.
Disclosure; p; English.
Random point mutations were introduced into the alpha fragment of
E.coli beta-galactosidase. The wild type sequence was obtained as a
single stranded template and an oligonucleotide was hybridised to
it to generate a popn of DNA molecules which terminate at all
possible nucleotide positions within a specified region. The
variable 3' ends generated in this way are used as primers for
reverse transcriptase. Nucleotides are emisincorporated by the
transcriptase and the molecules are completed to forms that can be
amplified and then expressed in a suitable host-vector system.
The sequence covers all 176 difft base substitutions, most of which

Oligonucleotide probe MK14-A consists of nucleotides 5-95 of (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also Q51735-45 and Q51747-59.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NR P-PSDB; P50032.

The Modified human beta interferon polypeptide(s) - prepd. by plasmid transformed bacteria, with improved antiviral, anti-proliferative and immune regulating actions

PT plasmid transformed bacteria, with improved antiviral, anti-proliferative and immune regulating actions

PT plasmid transformed bacteria, with improved antiviral, anti-proliferative and affair actions

CC Compared with interferon beta prepd. by recombinant methods, the compared with interferon beta prepd. by recombinant affairlies consists of the invention are more active and have different affairlies for cell surface receptors (allowing selective targetting); they have higher therapeutic index; improved stability against microbial creakedown during synthesis; and better in vivo solubility and stability. They are also easier to recover from incubation mixts.

Disciplants, Tayley in Laugh in Light and the specification describes antisense oligonucleotides (X52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides (specifically X55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carringmas eq. colon cancer, breast cancer, lung cancer, parents and control cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize or have metastasized to the lungs, including breast and prostate cancer. comprising at follows: X(NNB)11(TGC)(NNB)7(TGC)(NNB)10Y. X
and Y are flanking restriction sites (X is not the same as Y) that are
not specified further. Other generic sequences are shown in 070466-68.

Chher specific peptides generated by these generic sequences are shown in
K65151-54. TSARS are concatenated heterofunctional proteins or peptides,
comprising at least two functional regions - a binding domain with
affinity for a ligand and a second effector peptide portion that is
chemically or biologically active. They may further comprise a linker
peptide between the 2 domains. The oligonucleotides are also designed so
that the expressed peptide contains 2 or 4 cysteine residues positioned
in, or flanking, the unpredicted or variant residues. These residues
confer some degree of conformational rigidity to the peptides. The TSARS
confer some degree of conformational rigidity to the peptides. The TSARS
confer some degree of conformation of macromolecules, eg.
cell. They can also replace the function of macromolecules, eg.
cell. They can also replace the function of macromolecules, eg.
conjusted the TSARS are easily characterised and have designed activity
concerns allowed by the conformation or in vivo antibody
concerns allowed easily characterised and have designed activity
concerns the conformation of a screening process. Identifying proteins or peptide(s) which bind a ligand - by screening a recombinant vector library expressing fusion proteins screening a recombinant vector library expressing fusion proteins screening a brothing a binding domain and an effector domain bisclosure; Page 35; 255pp; English.

Q70466 is a generic DNA sequence used to generate random TSAR (Totally Synthetic Affinity Reagents) peptides. This generate formula can also be represented as follows:X(NNB)1(TGC)(NNB)10(TGC)2(NNB)42(NNB)8(TGC)(NNB)9.

Y. X and Y are flanking restriction sites (X is not the same as Y) that are not specified further. Other generic sequences are shown in \$707466.68. Other specific peptides generated by these generic sequences are shown in R65151-54. TSARs are concatenated heterofunctional proteins or peptides, comprising at least two functional regions - a binding domain with affinity for a ligand and a second effector peptide portion ö 415 TGACACCACCGCCTGTACGACTTCAACTCCTACTGGAGGGTGCACGCTGGAAACTTCTC 474 BNNBNNBNNBNNBNNBNNBNNBNNBTGCNNBNNBNNBNNBNNBNNBNNBNNNNNNNNNBNN 65 Generic DNA sequence to generate a random TSAR-9 petide library. monoclonal or polyclonal antibodies and therefore circumvent the need for complex methods of hybridoma formation or in vivo antibody production. The TSARs are easily characterised and have designed activity allowing direct and rapid detection in a screening process. Sequence 114 Bp; 0 A; 4 C; 4 G; 4 T;
that is chemically or biologically active. They may further comprise a linker peptide between the 2 domains. The oligonucleotides are also designed so that the expressed peptide contains 2 or 4 cysteine residues positioned in, or flanking, the unpredicted or variant residues. These residues confer some degree of conformational rigidity to the peptides. The TSARs or compsns. comprising a TSAR binding domain can be used in vivo to deliver a chemically or biologically active molety, es. metal ion, radioisotope, peptide, toxin or enzyme, to the specific target or on the cell. They can also replace the function of macromolecules, eg.

Claim 5; Page 38: 71pp; English.
A method for treating airway disease in a subject has been produced,
which involves the topical administration of an essentially adenosine
free antisense oligonucleotide (ON) to the airway epithelium of the
subject. The present sequence is an antisense oligonucleotide specific
for the human endothelin-1, targeted at the initiation codon. The
method can be used to treat airway diseases such as cystic fibrosis,
asthma, chronic obstructive pulmonary disease, bronchitis and other
airway diseases characterised by an inflammatory response. By
eliminating adenosine from the antisense ON, its liberation upon
eliminating adenosine from the antisense on reventing adenosine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        53 BCCCBCCGCGCTGBGCTCBGCGCCTBBGBCTGCTGTTTCTGGBBGCTCCTTGGCBBGCCBC 112

```
Amethod for treating alrayd disease in a subject has been produced, which involves the topical administration of an essentially adenosine free antisense oligonucleotide (ON) to the airway epithelium of the subject. The present sequence is an antisense oligonucleotide specific for chymase, targeted at the initiation codon. The method can be used to treat airway diseases such as cystic fibrosis, asthma, chronic obstructive pulmonary diseases, bronchitis and other airway diseases characterised by an inflammatory response. By eliminating adenosine from the antisense ON, its liberation upon antisense degradation is prevented, thereby preventing adenosine—induced bronchoconstriction in patients with hyper-reactive airways.

Sequence 190 BP; 1 A; 41 C; 58 G; 36 T;
                                                                                                                                                                                                                                                              Metzger WJ, Nyce JW;
WPI; 97-051871/05.
Treatment of airway diseases such as asthma - by topically applying adenosine-free antisense oligo:nucleotide to airway epithelium of
                                                                         Chymase antisense oligonúcleotide.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

**NOTE: This is a 'working draft' sequence. It currently
**consists of 1 contigs. The true order of the pieces
**is not known and their order in this sequence record is
** arbitrary. Gaps between the contigs are represented as
** runs of N. but the exact sizes of the gaps are unknown.
** This record will be updated with the finished sequence
** as soon as it is available and the accession number will
** be preserved.

On Jul 30, 1999 this sequence version replaced gi:5597062.

For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu. All contigs in this submission meet the following cutoffs: length >= 200 bases. Pl library location:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NOTE: This is a 'working draft' sequence. It currently consists of 74 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         of 619 bp in length

Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Web site: http://www-seq.wi.mit.edu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 * sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads * and the order in which they appear is completely arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. * However, it should not be assumed that this clone * will be sequenced to completion. In the event that the record is updated, the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Web site: http://www-seq.wi.mit.edu
